

Abstract

The present invention discloses a glove package, which comprises an outer hermetically sealed envelope openable under preset conditions. The outer hermetically sealed envelope encloses a) an inner envelope which comprises a first inner sheet and a second inner sheet in substantial overlying relationship, in which the first inner sheet having one longitudinal free edge in overlying relationship with a free longitudinal edge of the second inner sheet; b) at least one glove disposed between the first inner sheet and the second inner sheet, wherein a cuff portion of at least one glove is substantially aligned with the free edges of the first inner sheet and the second inner sheet; and c) suitable grasping means – including apertures on the inner envelope and/or tabs that project from the inner sheets and into the cuff portions - for enabling each of opposed sides of the cuff portion in proximity to the first inner sheet and the second inner sheet, respectively, to be held firmly with respect to the first inner sheet and the second inner sheet, respectively, at least during a part of a preset unpacking procedure of the package.
